environment using logical connections to one or more remote computers, such as remote computer **1580**. Remote computer **1580** may be a personal computer (laptop or desktop), a mobile device, a server, a router, a network PC, a peer device or other common network node, and typically includes many or all of the elements described above relative to computer system **1510**. When used in a networking environment, computer system **1510** may include modem **1572** for establishing communications over a network **1571**, such as the Internet. Modem **1572** may be connected to bus **1521** via user network interface **1570**, or via another appropriate mechanism.

[0069] Network **1571** may be any network or system generally known in the art, including the Internet, an intranet, a local area network (LAN), a wide area network (WAN), a metropolitan area network (MAN), a direct connection or series of connections, a cellular telephone network, or any other network or medium capable of facilitating communication between computer system **1510** and other computers (e.g., remote computer **1580**). The network **1571** may be wired, wireless or a combination thereof. Wired connections may be implemented using Ethernet, Universal Serial Bus (USB), RJ-11 or any other wired connection generally known in the art. Wireless connections may be implemented using Wi-Fi, WiMAX, and Bluetooth, infrared, cellular networks, satellite or any other wireless connection methodology generally known in the art. Additionally, several networks may work alone or in communication with each other to facilitate communication in the network **1571**.

[0070] As one application of the exemplary computing environment **1500** to the technology described herein, consider an example system for analyzing DHM data for hematology applications which includes a network component, a modeling processor, and a GUI. The networking component may include network interface **1570** or some combination of hardware and software offering similar functionality. The networking component is configured to communicate with a DHM system to retrieve DHM images. Thus, in some embodiments, the networking component may include a specialized interface for communicating with DHM systems. The modeling processor is included in a computing system (e.g. computer system **1510**) and is configured with instructions that enable it to train a classifier for cell types present in cell images extracted from DHM images received via the networking component. The modeling processor may include additional functionality, as described in this disclosure, to support this task (e.g., segmentation, identifying connected components, etc.). The modeling processor is further configured to use the classifier to determine the probability that new cell images belong to one of the types used to train the classifier. The GUI may then be presented on a display (e.g., display **1566**) for review by a user.

[0071] The embodiments of the present disclosure may be implemented with any combination of hardware and software. In addition, the embodiments of the present disclosure may be included in an article of manufacture (e.g., one or more computer program products) having, for example, computer-readable, non-transitory media. The media has embodied therein, for instance, computer readable program code for providing and facilitating the mechanisms of the embodiments of the present disclosure. The article of manufacture can be included as part of a computer system or sold separately.

[0072] While various aspects and embodiments have been disclosed herein, other aspects and embodiments will be apparent to those skilled in the art. The various aspects and embodiments disclosed herein are for purposes of illustration and are not intended to be limiting, with the true scope and spirit being indicated by the following claims.

[0073] An executable application, as used herein, comprises code or machine readable instructions for conditioning the processor to implement predetermined functions, such as those of an operating system, a context data acquisition system or other information processing system, for example, in response to user command or input. An executable procedure is a segment of code or machine readable instruction, sub-routine, or other distinct section of code or portion of an executable application for performing one or more particular processes. These processes may include receiving input data and/or parameters, performing operations on received input data and/or performing functions in response to received input parameters, and providing resulting output data and/or parameters.

[0074] A graphical user interface (GUI), as used herein, comprises one or more display images, generated by a display processor and enabling user interaction with a processor or other device and associated data acquisition and processing functions. The GUI also includes an executable procedure or executable application. The executable procedure or executable application conditions the display processor to generate signals representing the GUI display images. These signals are supplied to a display device which displays the image for viewing by the user. The processor, under control of an executable procedure or executable application, manipulates the GUI display images in response to signals received from the input devices. In this way, the user may interact with the display image using the input devices, enabling user interaction with the processor or other device.

[0075] The functions and process steps herein may be performed automatically or wholly or partially in response to user command. An activity (including a step) performed automatically is performed in response to one or more executable instructions or device operation without user direct initiation of the activity.

[0076] The system and processes of the figures are not exclusive. Other systems, processes and menus may be derived in accordance with the principles of the invention to accomplish the same objectives. Although this invention has been described with reference to particular embodiments, it is to be understood that the embodiments and variations shown and described herein are for illustration purposes only. Modifications to the current design may be implemented by those skilled in the art, without departing from the scope of the invention. As described herein, the various systems, subsystems, agents, managers and processes can be implemented using hardware components, software components, and/or combinations thereof. No claim element herein is to be construed under the provisions of 35 U.S.C. 112, sixth paragraph, unless the element is expressly recited using the phrase "means for."

1. A method for analyzing digital holographic microscopy (DHM) data for hematology applications to perform white blood cell differentiation, the method comprising:
